https://github.com/automl/DAC   *DAC*
Role: Developer
DAC is the first dynamic algorithm configurator which enables configuration not only to specific problem instances
but also at each time-step. To gain insights into the strengths and weaknesses of this reinforcement learning based
configurator DAC comes with example white-box benchmarks.

https://github.com/automl/DACBench   *DACBench*
Role: Contributor
DACBench is a benchmark library for Dynamic Algorithm Configuration. Its focus is on reproducibility and comparability of different DAC methods as well as easy analysis of the optimization process.

https://github.com/automl/ParameterImportance *PyImp*

Role: Developer

PyImp is an easy to use tool that helps developers to identify the most important parameters of their algorithms. Given the data of a configuration run with SMAC3, PyImp allows for usage of various parameter importance methods to determine which parameters have the most influence on the algorithms behaviour.

Former Role: Contributor

Python implementation of SMAC (sequential model-based algorithm configuration). SMAC is a tool for automated algorithm configuration.
